Education

Zhejiang University *Sept. 2020 - Now*

B.S. in Mathematics

- Major GPA: 3.80/4.00 (top 1/64 in sophomore year)
- Math Average: 91.3
- Core Courses:
  - Ordinary Differential Equation: 95
  - Mathematical Analysis II/III: 93
  - Real Variable Analysis: 93
  - Mathematical Software: 99
  - Mathematical Statistics: 92
  - Point Set Topology: 93
  - Advanced Algebra II: 95
  - Abstract Algebra: 90
  - Geometry: 90

Selected Research

Enhanced Transformer with Contexualized Equivariant Position Encoding *May. 2024 - Sept. 2024*

Supervised by Prof. Zhangyang Wang *University of Texas at Austin*

- Introduced TAPE, a novel framework for dynamically layer-updated positional embeddings in transformers, adapting to content and surpassing the limitations of fixed long-term decay in traditional positional embeddings.
- Proposed the principles of permutation invariance and orthogonal equivariance to enhance the generalization of positional embeddings, and designed an enhanced Transformer with modules that integrate positional information into both the attention and feedforward layers in alignment with these principles.
- Demonstrated that TAPE excels in language modeling and downstream tasks such as arithmetic reasoning and long-context retrieval, achieving strong performance in both pretraining from scratch and parameter-efficient fine-tuning.

Interpretability of Geometric Deep Learning for Scientific Tasks *Dec. 2022 - Apr. 2024*

Supervised by Prof. Pan Li *Georgia Institute of Technology*

- Adapted 12 interpretability techniques from graph neural networks to geometric deep learning models, which are widely employed in scientific tasks, and benchmarked their performance.
- Proposed the definition of two critical concepts in the domain of interpretability: sensitive patterns and decisive patterns, highlighting their misalignment, an aspect previously overlooked by researchers.
- Derived key insights from empirical evidence to guide the effective and appropriate application of two major categories of interpretability techniques: post-hoc methods and self-interpretable methods.

Ongoing Research

Interpretable State-Space Model with Enhanced Selective Mechanism *Oct. 2024 - Now*

Supervised by Prof. Zhangyang Wang *University of Texas at Austin*

- Proposed multiple approaches to implement an interpretable version of Mamba, named S7, leveraging the information bottleneck technique.
- Demonstrated that S7 achieves inherent interpretability without compromising generation performance, as validated on common language benchmarks.

Beyond Linear Separability of Attack-Defense in Latent Space of LLMs *Dec. 2024 - Now*

Supervised by Prof. Prateek Mittal *Princeton University*

- Proposed a backdoor attack that breaks the linear separability of attack-defense by injecting diversified poisoned data, enabling it to bypass defenses like BEEAR and Refusal-Direction based on linear separability assumptions.

Full Experience

LLM-based Agent for Automatic Cell Type Annotations *May. 2024 - Dec. 2024*

Remote Research Intern Supervised by Prof. Zhiting Hu *University of California San Diego*

- Proposed a framework empowering LLM-based agents to generate hypotheses, conduct experiments, perform evaluations, and iteratively refine hypotheses based on evaluation outcomes.
- Validated the approach through benchmarking on cell type annotation datasets and conducted a user study utilizing a streamlined user interface designed for scientists.

Interactive Reasoning of Visual Language Models *Dec. 2023 - Apr. 2024*

Research Intern Supervised by Prof. Yaochu Jin *Westlake University*

- Proposed a paradigm enabling interaction with visual language models (VLMs) through visual referencing, specifically utilizing "click and segment" actions to improve interactivity and reference accuracy.
- Enhanced the reasoning capabilities of VLMs for image segmentation by fine-tuning them on a custom-built multimodal dataset.

Mitigating Structural Divergence in Fine-tuning Graph Neural Networks *Aug. 2022 - Oct. 2022*

Supervised by Prof. Yang Yang *Zhejiang University*

- Provided a theoretical analysis using Taylor decomposition to guide the design of our method, breaking down the module output from a complete matrix into a linear combination of coefficients and bases.
- Validated the effectiveness of our method by implementing five baseline approaches and benchmarking performance across eight molecular datasets.

Graph Neural Networks for Electronic Property Prediction *Jan. 2022 - Jun. 2022*

Team Leader Supervised by Prof. Renjun Xu *Zhejiang University*

- Collected 100k+ data of electronic density and band structure from material database.
- Adapted CGCNN and MEGNet models for accurate electronic property prediction.

Additional Information

- Programming languages: Python, C/C++, CUDA.
- Software & Frameworks: LaTeX, Git, PyTorch, PyTorch Geometric, Transformers, Triton, Equinox.
- Interests: Guitar (performed at the school's New Year party), Skiing, Basketball, Snooker.
